

Energy and environmental policy

The careful use of all resources corresponds both the economic and ecological principle of the Jäger-Plastik GmbH & Co. KG, the compliance of the relevant legal obligations of administrative and other demands is a matter of course for us.

- We want to harmonize ecology and economy and commit ourselves to provide our workforce with all information and resources that are necessary to achieve our strategic and operative objectives.
- All employees to that effect are informed and trained because everyone has to be an example with its own personal behavior for environmental protection and the economical use of energy.
- All production stages are included in the ecological weak-point analysis. The production processes are continuously further developed with the best available economically feasible technology. The careful handling with resources and a preferably low environmental pollution already play an important role in the product and process development.
- We talk frankly about our environmentally relevant activities, about the consequences and improvements with employees, customers, suppliers, public authorities and the interested public.
